Combination Therapy: A Historical Perspective

Checkmate 214 – Ipilimumab + Nivolumab for Advanced RCC

André P. Fay, MD, PhD

Professor of Medicine - PUCRS School of Medicine
Chief, Medical Oncology Department – HSL/PUCRS
Visiting Scientist at Dana-Farber/Harvard Medical School

March, 1st, 2018

Disclosure

- Honoraria: Pfizer, BMS, Novartis, Roche, AstraZeneca, MSD
- Scientific Advisory Board: Janssen, Novartis, Roche, Pfizer
- Research Grant: CAPES – CNPq, BMS, AstraZeneca, MSD, Roche, Pfizer

Why to combine therapies?

- To enhance efficacy
- To target key pathways in a characteristically synergistic or an additive manner
- To reduce drug resistance
- Combination Chemotherapy – Medicine’s Attempt to Beat Darwin

Improving the effectiveness of the treatment of tuberculosis

- 1952: Isoniazid, Pyrazinamide
- 1970: Rifampicin
- 2010: Ethambutol

The main reason for the improved effectiveness of combination therapy is prevention of the emergence of resistance to individual drugs

Combination Therapy Versus Monotherapy in Reducing Blood Pressure: Meta-analysis on 11,000 Participants from 42 Trials

David S. Wald, MD, Malcolm Law, FRCP, Joan K. Morris, PhD, Jonathan P. Bestwick, MSc, Nicholas J. Wald, FRS

Wolfson Institute of Preventive Medicine at Barts and The London Queen Mary's School of Medicine and Dentistry, Charterhouse Square, London, United Kingdom.

CLINICAL SIGNIFICANCE

- Monotherapy is the standard initial treatment for reducing blood pressure, with stepwise increases in dose if the desired decrease in blood pressure is not achieved.
- Combining drugs from different classes is approximately 5 times more effective in lowering blood pressure than increasing the dose of 1 drug.
- Combination therapy is the preferred initial strategy in the treatment of high blood pressure.

Testicular Cancer: A Reflection on 50 Years of Discovery

Nasser Hanna and Lawrence H. Einhorn, *Indiana University School of Medicine, Indianapolis, IN*

Testicular Cancer: cure in ~ 95% of all patients

Table 3. Landmark Achievements in Testicular Cancer

Year	Event	Significance	Ref
1937	hCG first reported in the urine of patients with testicular cancer	Improved ability to diagnose, stage, assess response, detect relapse, estimate prognosis	3
1940s	Seminomas are radiation-sensitive	95% cure rate for stage I or II seminoma prior to era of cisplatin-based chemotherapy	6
1960	Actinomycin-D based chemotherapy tested in advanced testicular cancer	Durable complete responses and some cures reported for the first time in patients with metastatic testicular cancer	40
1965	Discovery of cisplatin	Revolutionized the treatment of testicular cancer, achieving cures in > 80% of patients with metastatic disease	47
1974	PVB regimen first tested	Increased cure rate by 1 log compared with contemporaneous chemotherapy	50
1980s	Nerve-sparing RPLND	Preserves ejaculatory function in > 90% of patients undergoing this procedure	18-24
1981	PVB with or without maintenance vinblastine	Eliminated need for maintenance therapy	53
1985	EP regimen	Cures possible in the second-line setting	57
1987	PVB versus BEP	BEP supplants PVB as standard therapy	61
1989	BEP × 3 versus 4 cycles in good risk	Eliminates fourth cycle of BEP in good risk patients	63
1997	IGCCC prognostic groups	Allows for more accurate study of treatment outcomes by risk groups	66
2007	Largest series to date reported on HDCT in relapsed disease	Cures achieved in > third-line, poor-risk groups, including platinum-refractory patients	89

Abbreviations: BEP, bleomycin, etoposide, and cisplatin; EP, etoposide and cisplatin; hCG, human chorionic gonadotropin ; HDCT, high-dose chemotherapy; IGCCC, International Germ Cell Cancer Collaborative Group; PVB, cisplatin, vinblastine, and bleomycin; RPLND, retroperitoneal lymph-node dissection.

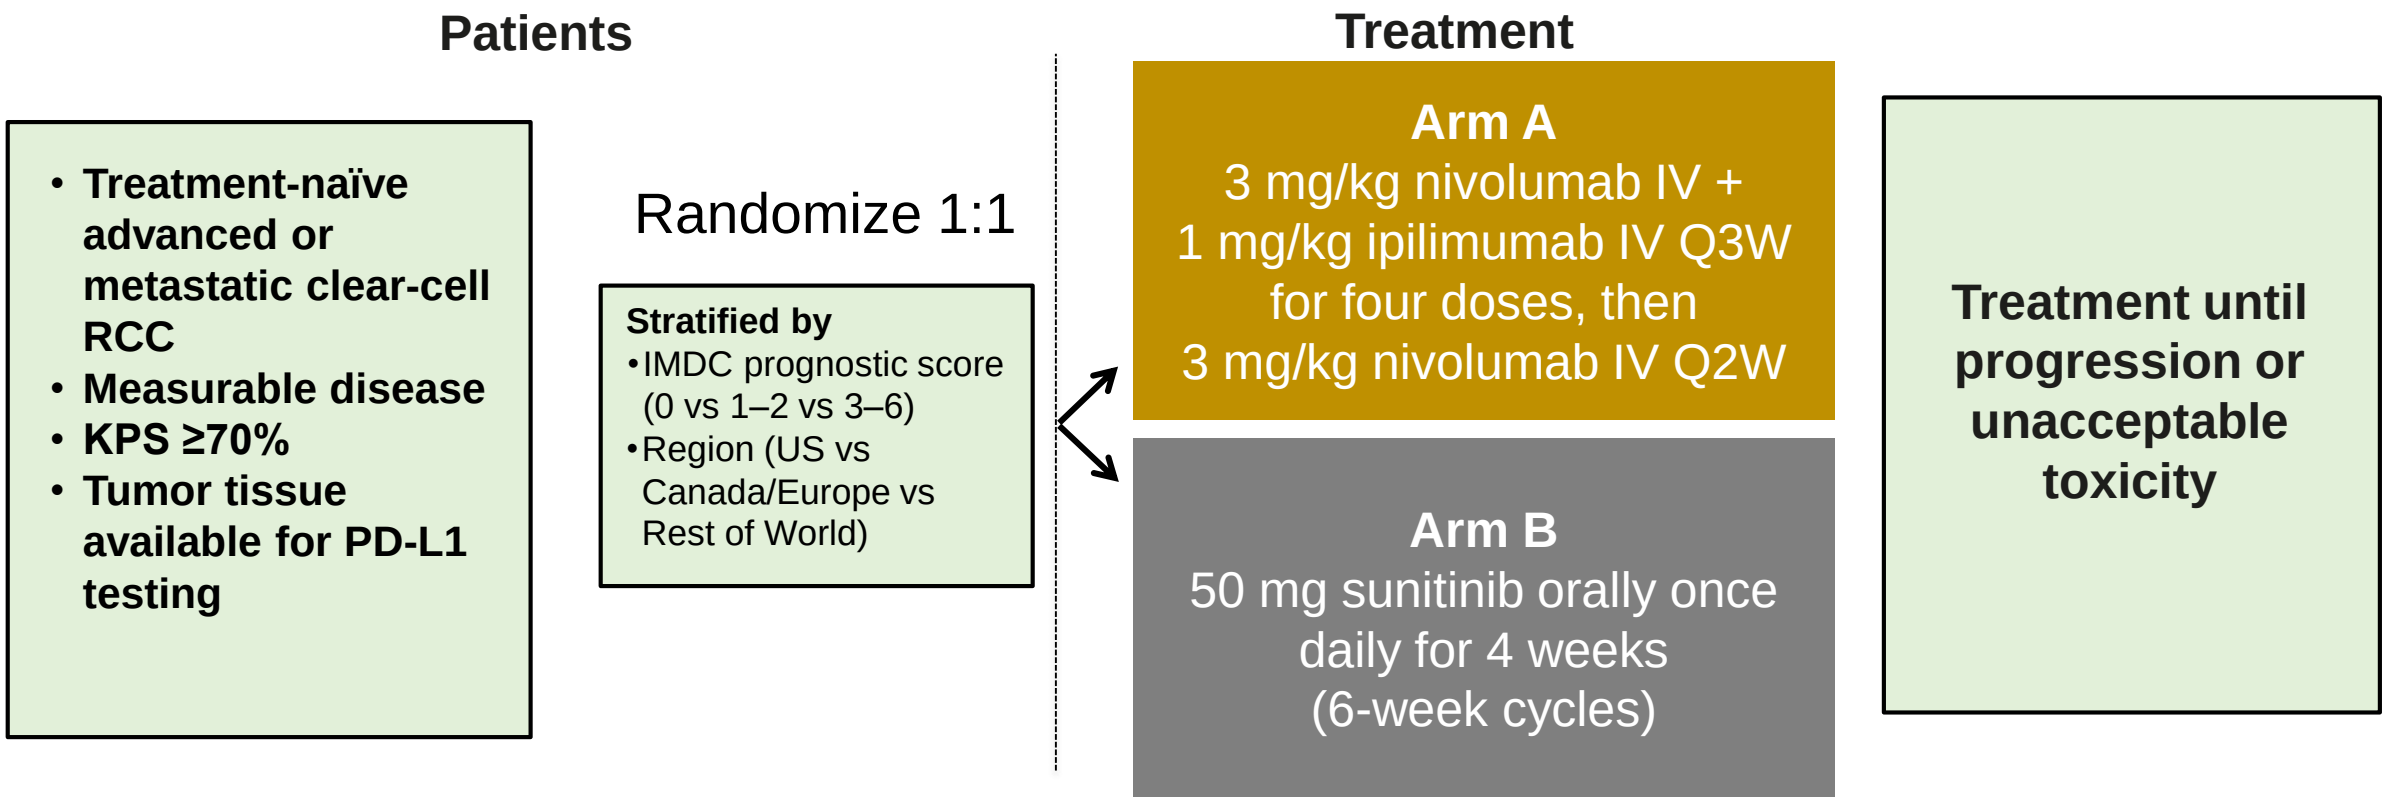
MADRID 2017 ESMO congress

CheckMate 214: Study design



IMDC, International Metastatic RCC Database Consortium; KPS, Karnofsky performance status; Q2W, every 2 weeks; Q3W, every 3 weeks

Co-primary endpoints

- **In IMDC intermediate- and poor-risk patients**
  - ORR (per independent radiology review committee, IRRC)
  - PFS (per IRRC)
  - OS
- **Statistical analyses**
  - Overall alpha is 0.05, split among the three co-primary endpoints
  - 0.001 for ORR, 0.009 for PFS, and 0.04 for OS
  - PFS analysis had 80% power and OS analysis had 90% power to detect a statistically significant difference between treatment arms

Secondary and exploratory endpoints

- **Secondary endpoints (in intention-to-treat [ITT] patients)**
  - ORR
  - PFS
  - OS
  - Adverse event incidence rate (in all treated patients)
- **Secondary efficacy endpoints** were subject to hierarchical testing, first testing in intermediate/poor-risk patients followed by testing in ITT patients, if significant
- **Exploratory endpoints**
  - ORR, PFS, and OS in favorable-risk patients
  - Outcomes by tumor PD-L1 expression level
  - Health-related quality of life based on NCCN Functional Assessment of Cancer Therapy-Kidney Symptom Index (FKSI-19)

Escudier B. ESMO 2017

Baseline characteristics

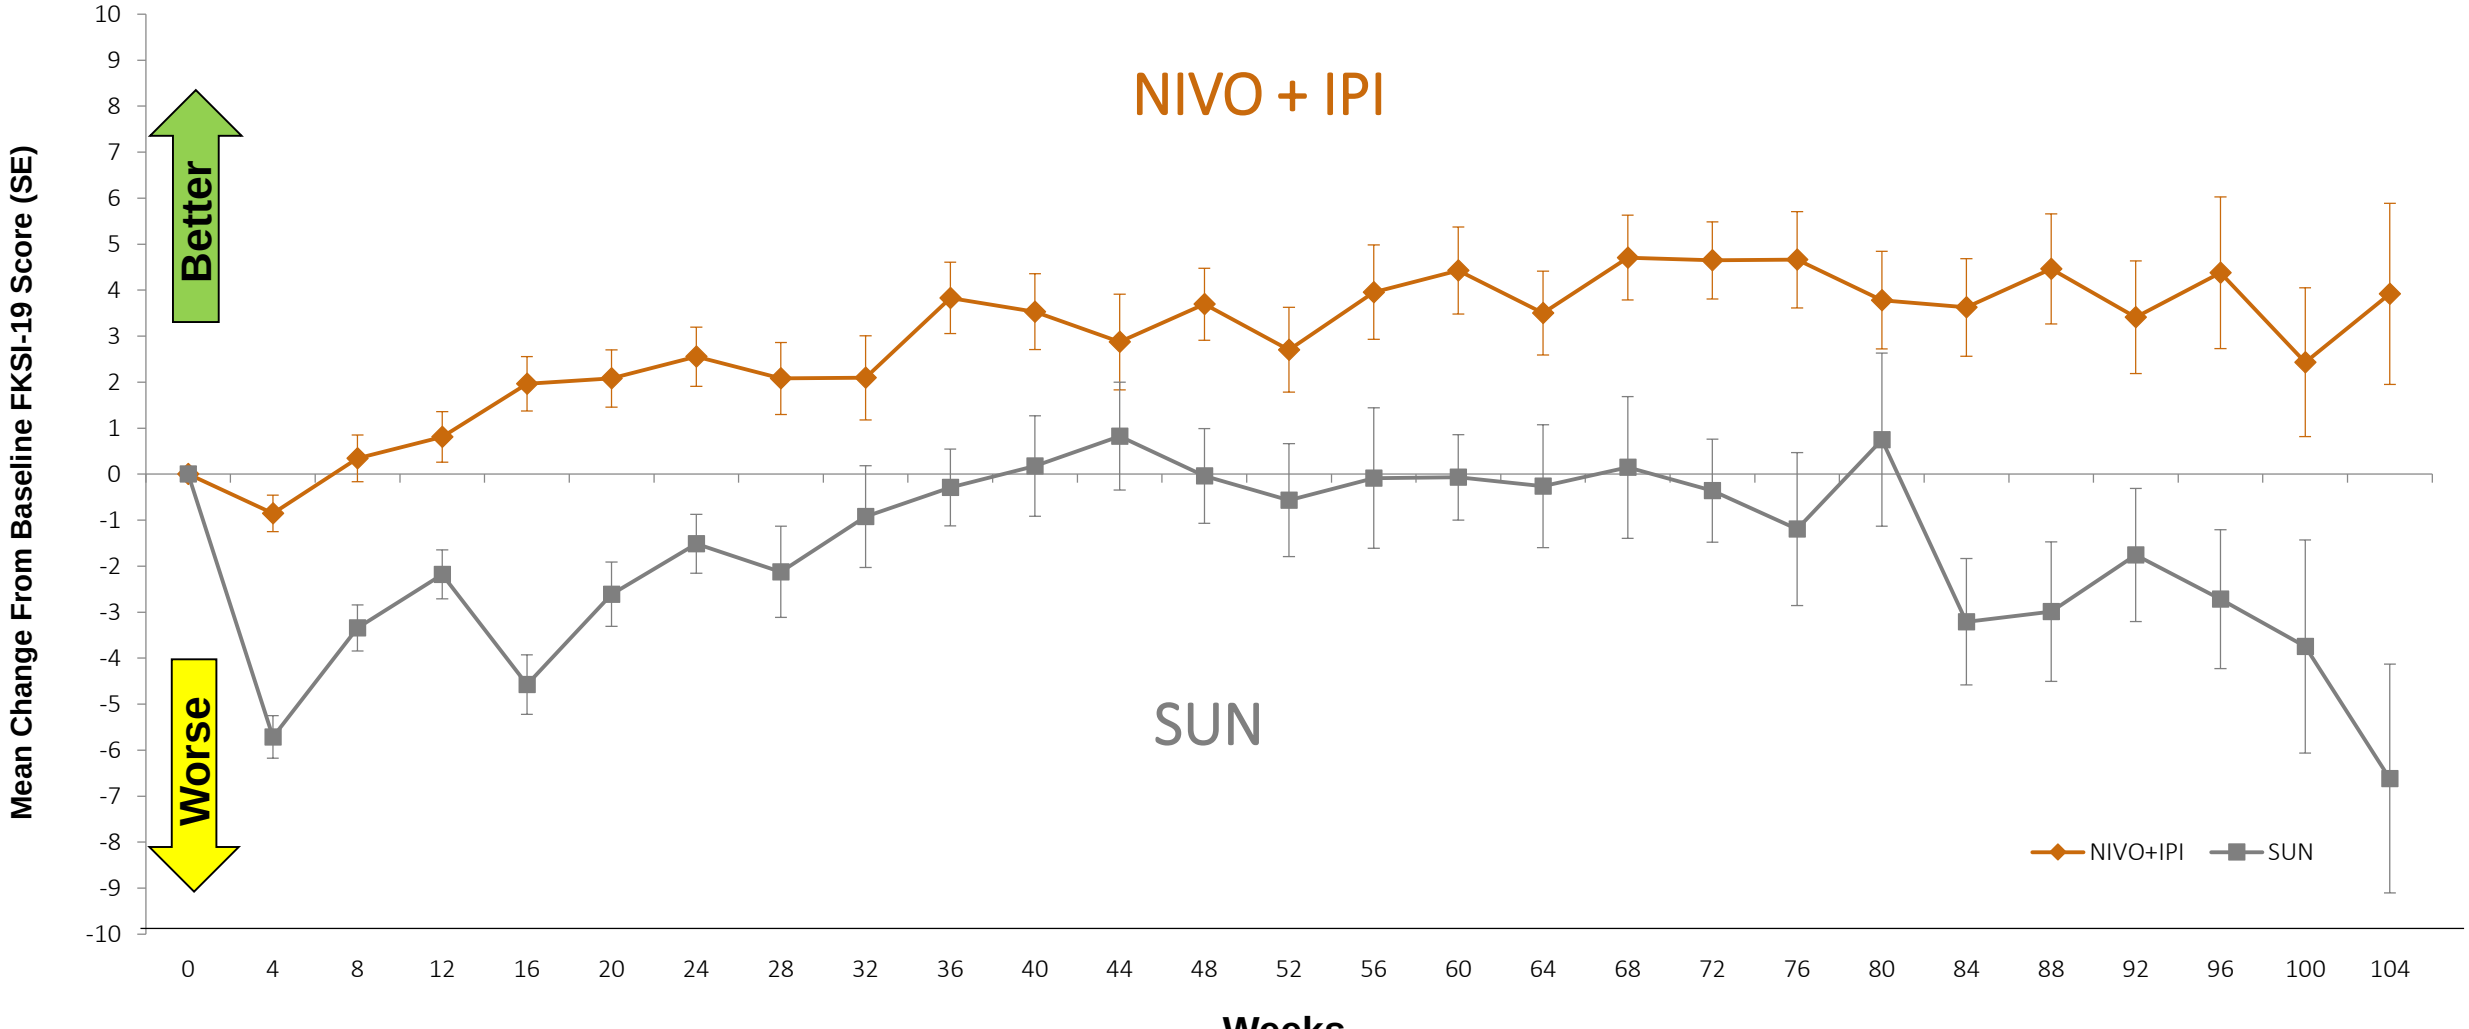
- 60% of patients treated with NIVO + IPI required systemic corticosteroids for an adverse event
- Secondary immunosuppression with infliximab (3%) and mycophenolic acid (1%) was reported

Escudier B. ESMO 2017

Patient-reported kidney cancer symptom index: IMDC intermediate/poor risk



No. at Risk

NIVO + IPI	425	347	281	239	212	180	166	152	143	139	125	108	76	44
SUN	422	371	284	221	184	147	127	113	104	93	80	64	43	26

Summary and conclusions

- In **IMDC intermediate/poor risk treatment-naïve aRCC**, CheckMate 214 demonstrated
  - Significantly improved ORR with NIVO + IPI versus SUN
    - 9.4% complete response rate
    - Durable responses, with median duration of response not reached
  - Median PFS improvement of >3 months with NIVO + IPI versus SUN
  - Significant OS benefit with NIVO + IPI versus SUN
    - Median OS: not reached (NIVO + IPI) and 26.0 months (SUN); HR 0.63; *P* = 0.00003
- Exploratory analysis of patients with tumor PD-L1 ≥1% demonstrated a higher ORR and improved PFS with NIVO + IPI versus SUN

Summary and conclusions

- **The safety profile of NIVO + IPI was manageable** and consistent with previous studies
  - More high-grade treatment-related adverse events were observed with SUN, although more patients had treatment-related adverse events leading to treatment discontinuation with NIVO + IPI
  - Patients in the NIVO + IPI arm experienced greater symptomatic improvement versus SUN
  - Throughout the course of the study, patients in the NIVO +IPI arm reported better symptom control relative to those in the SUN arm
- These results suggest that NIVO + IPI is a potential first-line treatment option for patients with aRCC, **with intermediate or poor IMDC risk, especially in those with PD-L1 expression ≥1%**

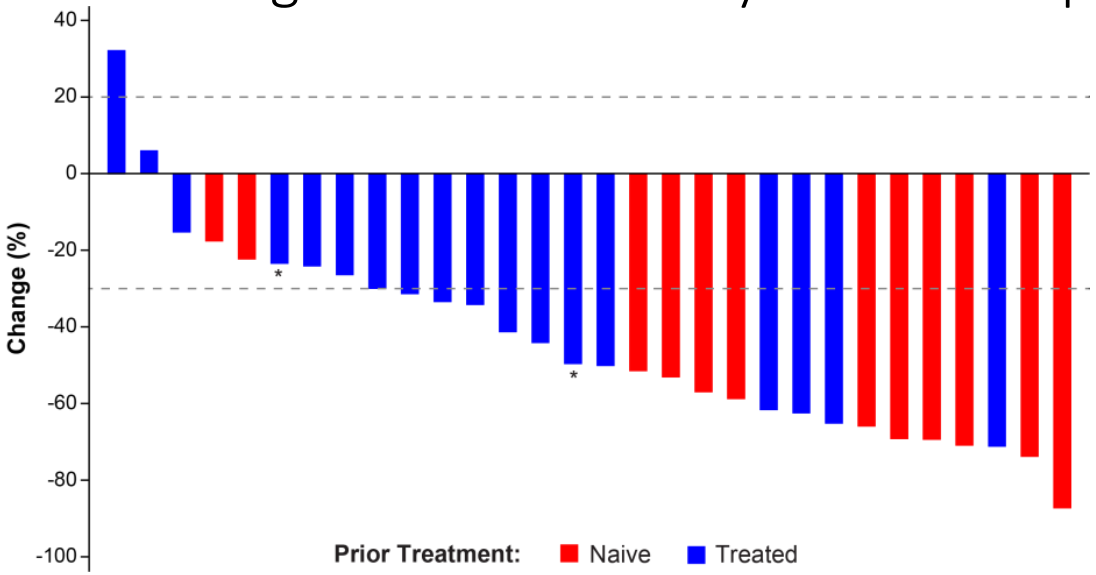
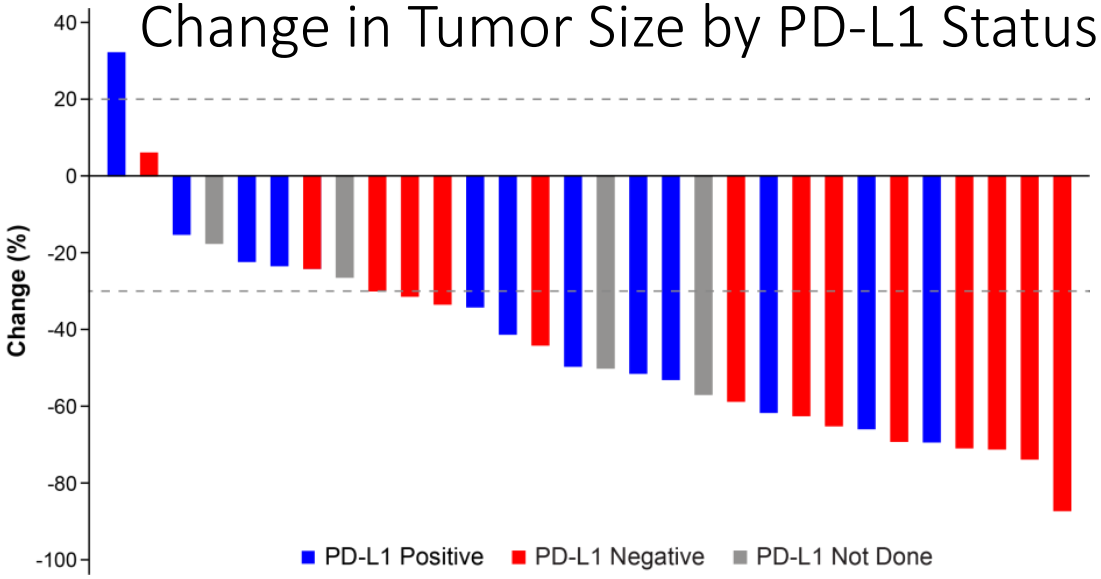
Parameter	Total (n = 30)	Treatment Naïve (n = 12)	Previous Treatments (n=18)
$ORR_{(Week\ 24)}$, n (%)	19 (63)	10 (83)	9 (50)
95% CI	44–80	52–98	26–74
ORR, n (%)	19 (63)	10 (83)	9 (50)
95% CI	44–80	52–98	26–74
BOR, n (%)			
Partial response	19 (63)	10 (83)	9 (50)
Stable disease	10 (33)	2 (17)	8 (44)
Progression	1 (3)	0	1 (6)

ESMO 2017.

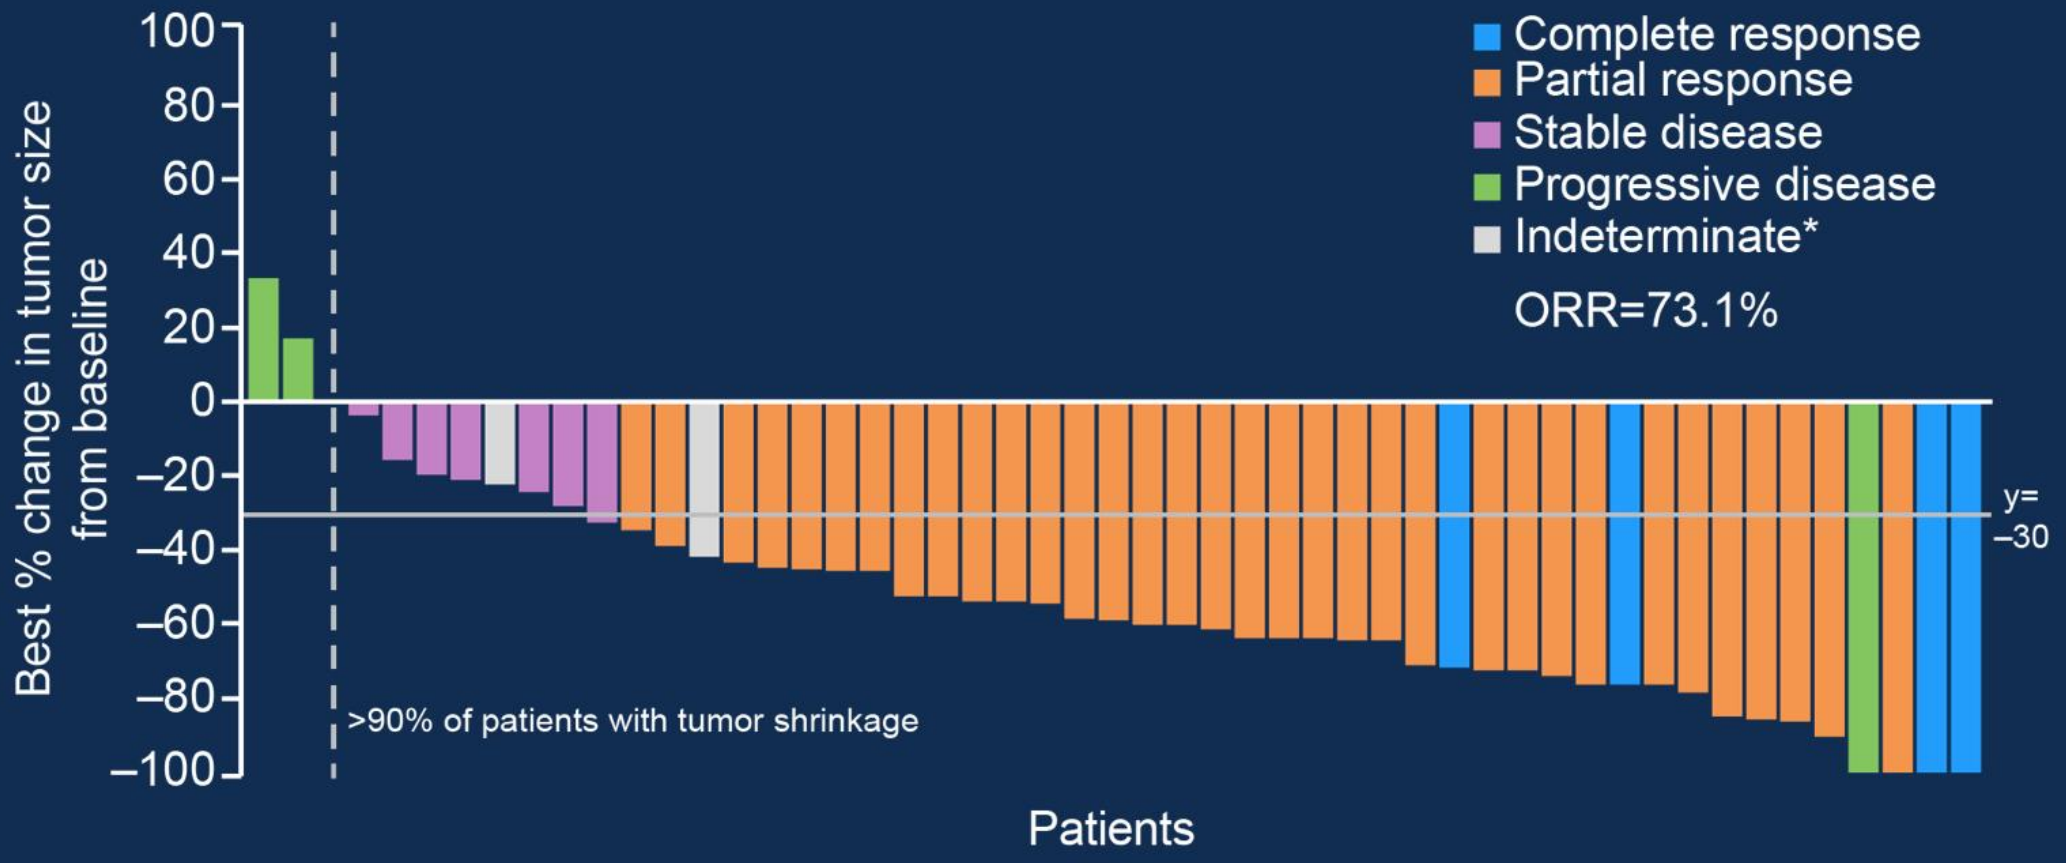
Change in Tumor Size by Prior Therapy



Change in Tumor Size by PD-L1 Status



Axitinib + Pembrolizumab



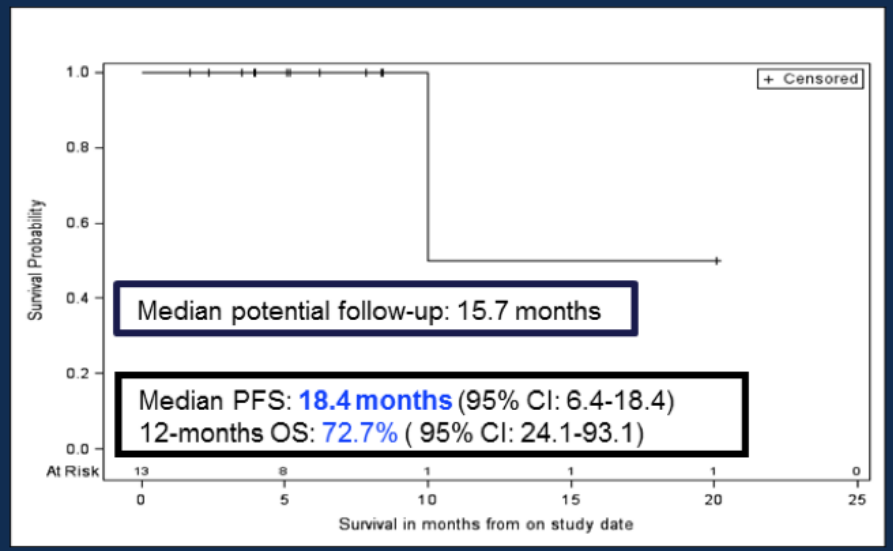
* Stable disease or partial response not confirmed, or no follow-up scans available.
ORR=objective response rate

Cabozantinib/Nivolumab +/- Ipilimumab

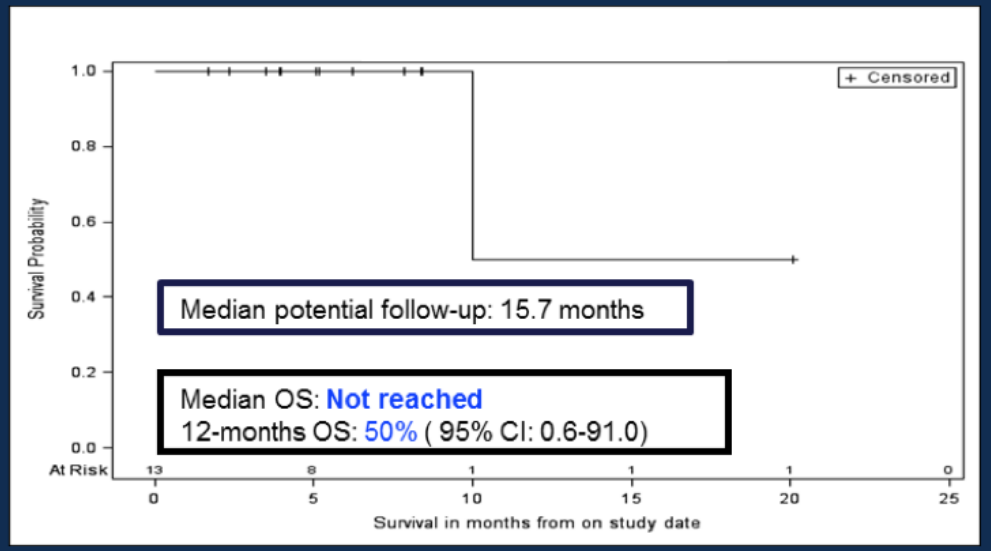
n (%)	Median F/U months	ORR	PR	CR	SD	PR+CR+SD
RCC N=13	5.2	**53.9%** (7/13) (95% CI: 25.1-80.8%)	**53.9%** (7/13) (95% CI: 25.1-80.8%)	0	**46.1%** (6/13) (95% CI: 19.2-74.9%)	**100%** (13/13) (95% CI: 75.3-100.0%)

RCC: Median Duration of Response: 18.4 months (95% CI: 6.4-18.4)

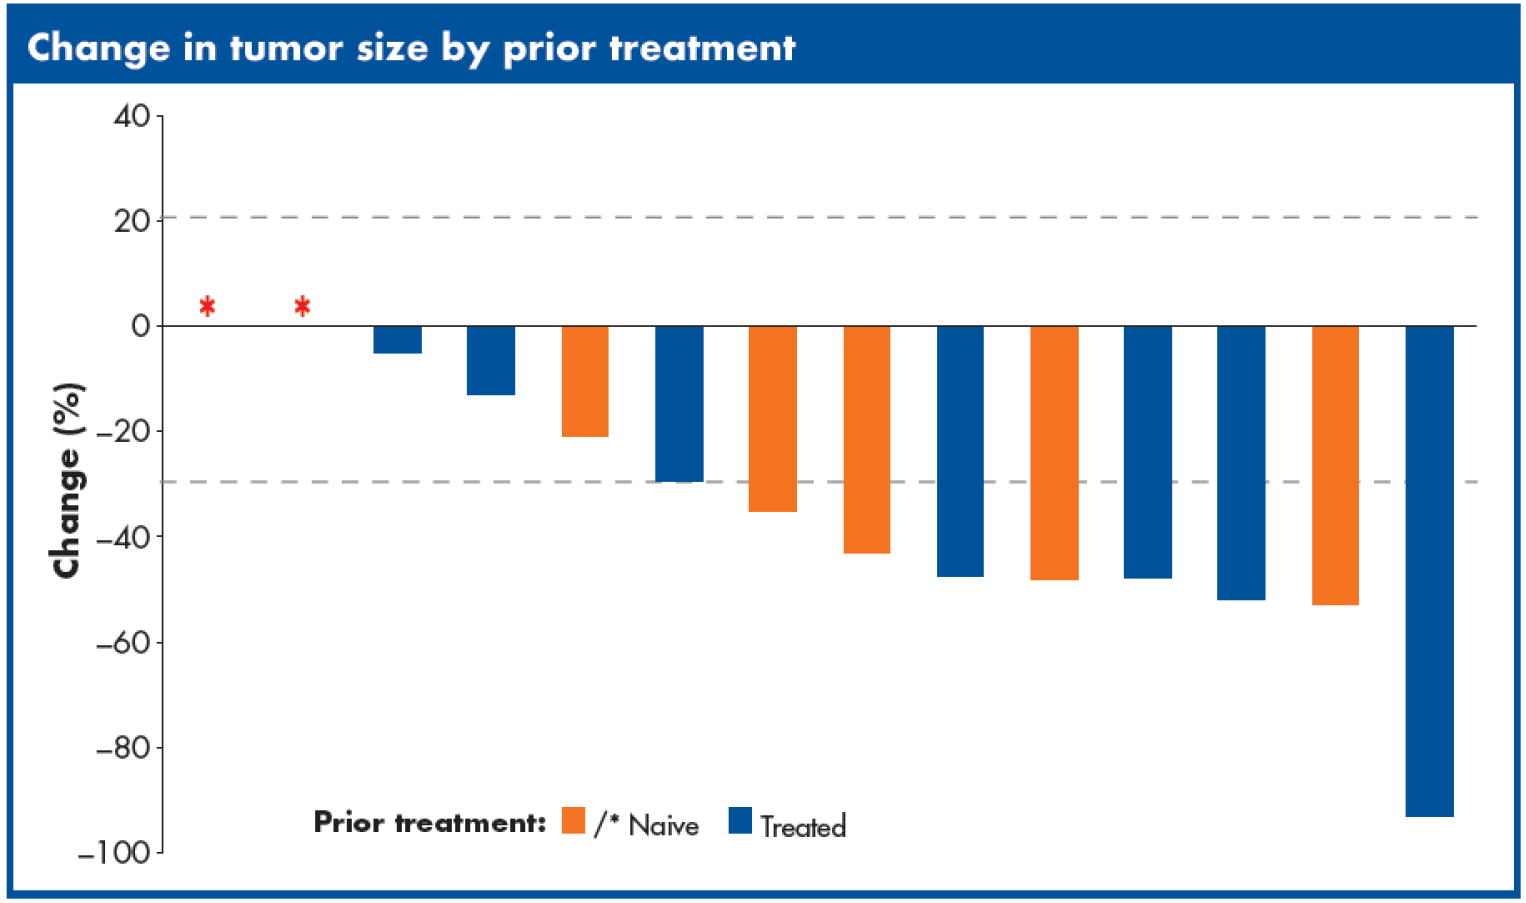
RCC: PFS



RCC: OS

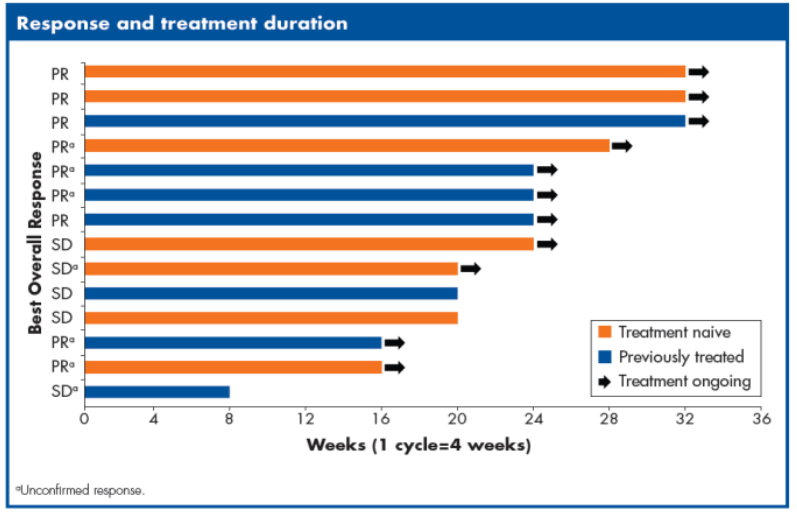


Tivozanib + Nivolumab



Response to treatment in patients receiving the full treatment dose with ≥2 treatment scans	
Best overall response, n (%)	**Patients (n=14)**
CR	0
PR	9 (64.3)[a]
SD	5 (35.7)[b]
Progressive disease	0
Objective response rate (CR + PR)	9/14 (64.3)
Disease control rate (CR + PR + SD)	14/14 (100)

CR, complete response; SD, stable disease.
[a]Includes 5 patients with an unconfirmed response.
[b]Includes 2 patients with an unconfirmed response.



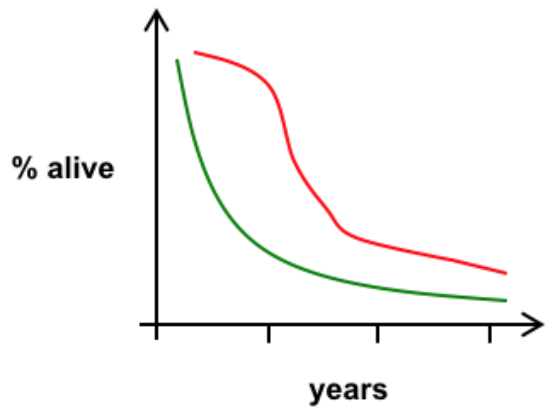
Presented by: Dr. Bernard Escudier - GUCS 2018

Future: Combination of therapies

Immunotherapy

Moderate Responses
Long-term duration

Targeted Therapy



High Responses
